When a player opens a <https://bitz.io/games/limbo-02> Limbo game, they set up two primary criteria:

1. **The Bet Amount:** How much cryptocurrency they desire to bet on the round.
2. **The Target Multiplier:** The payment multiplier they want to attain (e.g., 2x, 10x, 100x, and even as much as 1,000,000 x).

When these are set, the player starts the round. The game creates a random number. If the produced number is **higher than or equivalent to** the target multiplier, the gamer wins their bet multiplied by that target. If the generated number falls short, the bet is lost.

How Limbo Works: The Mechanics Behind the Bets

To understand why Limbo is so popular in the crypto gambling neighborhood, one must take a look at its core engine: **Provably Fair algorithms**.

Unlike standard online casinos where game results are computed on a black-box server, crypto-native video games utilize cryptographic hashing (normally utilizing SHA-256). Before a bet is placed, the gambling establishment generates a hashed version of the winning result. After the round concludes, gamers can verify the math to guarantee the casino did not control the result.
