Parameters affecting selectivity in RP-HPLC

Parameter	Usage
Organic solvent	Changing to a different solvent (e.g. Methanol to Acetonitrile in reversed phase HPLC) will alter the selectivity
Mobile phase pH	Can alter the degree of ionization of some analytes – affecting their hydrophobicity
Solvent strength and additives	Can be adjusted to affect selectivity as well as retention (capacity) factor
Stationary phase	One of the most popular ways to alter the selectivity of a separation
Temperature	Can have an effect with certain analytes in reversed phase and Chiral HPLC

At space temperature, lyophilized peptides usually stay steady for just 1-- 2 weeks depending upon the sequence.
