

If you're comparing **horse feed** and cubes, the simplest answer is this: **horse feed** remains the larger category, while cubes are a specific type of it. Horse feed can include blends, *nuts*, *pellets*, chaff-style rations, and *complete horse feed*, whereas cubes are dense, compressed units created to offer nutrition in a practical format.

The key difference is not just shape. It is about components, **nutritional value**, fibre content, starch, protein, digestibility, and how each product works within a horse's **feeding plan**. A smart choice depends on **forage first** principles, the horse's **workload**, **body condition**, and whether you need **hard feed**, **slow release energy**, or straightforward upkeep support.

What horse feed means

Horse feed is a processed or blended feed offered alongside **forage** such as **hay** and **haylage**. In practical terms, it covers many **types of horse feed**, from conventional mixes to fibre-based balancers and **complete horse feed** designed to supply a full ration in the bucket.

Most horses should consistently have forage as the foundation of their diet. Feed is then used to top up energy, protein, **vitamins and minerals**, and in some cases specific ingredients for **digestive health**, **weight management**, or improved **energy levels**. For that reason, the phrase horse feed is general rather than narrow.

Common **types of horse feed** include:

- **Mixes** with blended cereals, fibres, and added nutrients
- **Nuts** that are usually coarse, compact, and easy to store
- **Pellets** that provide a even format and consistent intake
- **Complete horse feed** products intended to replace some or all of the concentrate ration
- Fibre-based feeds and low-starch options for sensitive horses

A **balanced diet** for horses is never just about the bucket. It is about matching feed to forage, turnout, work, and condition. A horse in light work may only need a small ration, while a horse in hard work may need more concentrated nutrition to support performance and recovery.

For beginners, it helps to think of horse feed as the "umbrella term". The specific product type is what matters when you compare labels, feeding rates, and suitability.

Which cubes are in horse nutrition

Cubes are a type of **horse feed** made by compressing raw materials into compact, uniform chunks. They are often used because they are convenient to weigh, keep, and feed. Cubes can be fibre-rich, cereal-based, low-starch, or designed as a **complete horse feed** depending on the formula.

In horse nutrition, cubes are valued for reliability and everyday convenience. They generally offer solid **palatability**, which means many horses find them acceptable to eat, and some are designed to improve **digestibility** through carefully chosen **ingredients**. That makes them useful for horses that need consistent feeding without the fuss of a highly mixed ration.

Some **horse feed companies** produce cubes as part of a wider range that also includes mixes and pellets. [overweight horse feed](#) Others focus on specific blends, such as low-starch cubes for horses needing steadier **energy levels** or high-fibre cubes to support gut function.

Cubes may be chosen when owners want:

- An simple-to-use format in the **feed bucket**
- Reliable nutrient intake
- Less selective eating compared with mixed feeds
- A simple option for daily feeding routines
- A product that can fit a controlled **feed ration**

It is important not to assume all cubes are the same. Some are complete rations, some are partial feeds, and some are mainly a dense source of fibre, protein, or energy. That is why label reading matters more than the word “cubes” itself.

Equine feed vs cubes: the key differences

The main difference between horse feed and cubes is that horse feed is the category, while cubes are one format within that category. Yet the practical differences go further than shape.

Initially, cubes often provide a more uniform intake than loose **types of horse feed** such as mixes. Since each piece is similar, the horse cannot pick out favourite ingredients. This can help deliver a more consistent balance of **protein**, starch, fibre, and **vitamins and minerals**.

Next, mixes may be more appealing to some horses because of greater variety, while cubes can be more controlled and less sortable. For horses that are fussy, feed appearance and smell can affect palatability. For horses that need a strict ration, cubes can be easier to manage.

Finally, feeding rules matter. Many **horse feeding rules** focus on giving forage before concentrates, avoiding sudden changes, and dividing feed into sensible portions. This is where the difference between a feed and cubes becomes less important than the overall feeding strategy.

A practical **horse feeding chart** is more useful than choosing by shape alone. A horse in low work with good body condition may need little more than forage and a balancer. A horse in stronger work may need a larger concentrate ration, whether that comes as cubes, pellets, or a mix.

Below are the key comparison points:

- **Format:** horse feed is a general term; cubes are compressed pieces
- **Choice control:** mixes allow more visual variety, cubes reduce sorting
- **Feeding ease:** cubes are straightforward to measure and serve
- **Digestibility:** depends on ingredients, processing, and fibre content, not just shape
- **Usage:** both can suit different workloads and body condition goals

When you look at **horse feeding rules**, the best product is the one that supports a stable feeding plan, good condition score, and appropriate digestibility for the horse’s needs.

Which is considered better for your horse?

Neither horse feed and neither are cubes are necessarily better. The right choice depends on the horse, the workload, and the overall diet. For many owners, the right answer comes from matching feed to condition, temperament, and how much forage the horse already eats.

If you are new to feeding, **horse feed for beginners** should usually be straightforward, forage-led, and easy to assess. That often means beginning with the basics: hay or haylage, salt, water, and a modest concentrate only if needed. In many cases, a cube-based feed can be easier to understand because the serving is neat and repeatable.

For practical **horse feed advice uk**, a good rule is to keep the ration as basic as possible while meeting the horse's needs. If the horse maintains a healthy **condition score** on forage alone, extra hard feed may not be necessary. If the horse is struggling to hold weight, recovering from work, or needing more support, cubes or another concentrate may [low sugar feed supplement](#) help.

Consider these questions:

Bifid UK

+44 800 422 0888

sales@bifid.co.uk

<https://bifid.com/uk/>

- Is the horse in easy, moderate, or heavy **workload**?
- Is the horse too thin, overweight, or in ideal body condition?
- Does the horse need extra fibre, more calories, or more protein?
- Does the horse need **slow release energy** rather than a cereal-heavy ration?
- Does the horse cope well with mixes, or does it need a more uniform feed?

If your horse is a easy keeper, lower-starch cubes or a balancer may be enough. If your horse is a poor-doer, a higher calorie feed may be more suitable. The best option is the one that supports a healthy body condition without overfeeding starch.

For beginners, it is often wise to choose from trusted products, follow the feeding guide, and review the horse's response every few weeks. No single feed format suits every horse.

How to choose the best feed based on workload and condition

A smart feeding decision starts with workload and condition score. That is where a **horse feed calculator uk** can be handy as a starting point, but it should never replace observation of the horse itself. Calculators offer a guide; the horse gives the final answer.

Begin with the basics of **horse feeding rules**: put forage first, introduce changes gradually, feed meals in small portions where needed, and avoid unnecessary starch. Then build a ration around the horse's workload and body condition.

Take the following approach:

- **Low workload**: forage may be sufficient, or a small balancer/low-calorie feed
- **Moderate workload**: a controlled feed ration with cubes, nuts, or a mix may help
- **High workload**: energy-dense feed with attention to digestibility, fibre, and protein is often needed
- **Poor condition**: increase calorie intake carefully without upsetting gut function
- **Good-doer/overweight**: choose lower-calorie, lower-starch feeds and monitor intake closely

A basic **horse feeding chart** can help you think in categories rather than exact products. For example, a horse with a healthy condition score in light work may not need much beyond forage and a vitamin/mineral source. A

horse that is losing weight in sustained work may need a more substantial feed, perhaps a cube-based ration with higher digestibility.

Remember that forage quality matters too. Good hay or haylage may reduce the amount of hard feed needed. In contrast, poor forage may force you to rely more on concentrates. The best feeding plan balances forage, feed, and workload without overloading the digestive system.

When in doubt, choose the least complicated ration that meets the horse's energy, protein, and micronutrient needs. That is often the safest approach for digestive health and long-term management.

Horse feed cost and value for money

Horse feed cost can vary a lot depending on the ingredients, overall quality, manufacturing, and how concentrated the product is. The question **how much does horse feed cost** does not have a single answer, because a bag price alone does not tell you the full value.

Low-cost feed may seem attractive, but it can be poor value if you need to feed a large amount to meet the same nutritional goals. A more concentrated product can sometimes cost more per bag yet work out better value if the feeding rate is lower. This is why smart owners compare cost per day, not just cost per sack.

Elements that affect value include:

- Standard of ingredients
- Digestibility and nutrient density
- Feeding rate required
- Whether it is a complete horse feed or partial ration
- How well it matches workload and condition

Different **horse feed companies** position their products differently. Some focus on economy, others on specialist performance, and others on fibre-based or low-starch formulas. The best value is the one that meets the horse's needs without waste or overfeeding.

Also consider how a feed fits into the wider ration. If a product reduces the need for separate supplements, it may be better value overall. Likewise, a balanced feed that supports condition and energy efficiently may save money by preventing loss of weight or poor performance.

How to read labels and compare products

Reviewing the label is the quickest way to determine whether a feed is appropriate. This is particularly true for **complete horse feed** products, which should be assessed carefully rather than chosen by name alone. The label reveals the **ingredients**, analytical values, and suggested feeding rate.

When comparing products from different **horse feed companies**, look for the following:

- **Fibre content** and whether the feed is forage-based
- The starch amount, especially for horses needing more even energy
- The protein content and quality
- Added **vitamins and minerals**
- Amount fed per day per day
- Whether the feed is designed as a balancer, partial ration, or complete horse feed

If you are comparing a product such as **spillers horse feed** with another brand, do not focus only on the brand name. Compare the guaranteed analysis, target horse type, and intended use. A recognised brand may offer many different formulas, from cubes to mixes and specific performance feeds.

Understanding the label also helps you avoid misunderstanding terms like “complete”. In one product, complete may mean a full ration with very little need for other feed. In another, it may simply mean a nutritionally balanced hard feed that still needs forage as the foundation.

A good habit is to match the label to your horse’s actual needs rather than to marketing terms. That is the best way to build a sensible feeding plan.

Common feeding mistakes to avoid

Even the highest-quality horse feed can be undermined by poor feeding habits. Following the **10 rules of feeding horses** helps reduce risk and improve consistency. While different guides phrase them differently, the core principles are usually the same: forage first, change gradually, feed according to need, and monitor the horse closely.

Common mistakes include:

- Feeding too much hard feed and not enough forage
- Altering the ration too fast
- Ignoring the horse’s condition score
- Choosing a feed without checking starch levels, fibre, or protein
- Using a feed that does not fit workload
- Adding too many supplements without understanding what the feed already provides
- Assuming cubes are always better than other **types of horse feed**
- Not adjusting the ration through seasonal changes or changes in work

Another mistake is relying on a **horse feed mix recipe** made by guesswork. Home-mixing may appear cost-effective, but without proper formulation it can create shortfalls or excesses in energy, starch, protein, or micronutrients. If you are making your own mix, it should be done with a clear nutritional purpose and a proper understanding of the ration.

Horse feed advice uk often highlights practical simplicity: use forage as the base, make changes slowly, and keep an eye on body condition. The horse should tell you whether the plan is working through energy levels, weight, topline, and behaviour.

Good feeding is steady feeding. The right product in the wrong management system will still give poor results.

FAQ about horse feed and cubes

What is the difference between horse feed and cubes?

Horse feed is the broad term for feed given to horses alongside forage, while **cubes** are one specific format of horse feed. Cubes are compressed, uniform pieces that may be part of a mix, a pellet-style ration, or a **complete horse feed**. The difference is mainly format, but the ingredients and nutritional value matter more than the shape.

Are cubes better than other types of horse feed?

Not always. Cubes can be useful because they are easy to measure and less easy for horses to sort through, but other **types of horse feed** may suit certain horses better. The best choice depends on workload, body condition, digestibility, and whether the horse needs more fibre, protein, or slow release energy.

How do I figure out how much horse feed to feed my horse?

Start with forage, after that use a **horse feeding chart** or **horse feed calculator** [uk](#) as a reference. Adjust the amount according to workload, condition score, and how the horse seems and responds over time. Offer little and often where appropriate, and always follow general **horse feeding rules** rather than making a guess.

Is complete horse feed suitable for all horses?

No. **Complete horse feed** is suitable for some horses, especially those needing a convenient well-rounded ration, but it is not automatically appropriate for every horse. Some horses need more forage, less starch, or a different feed format. Always check whether the product matches the horse's workload, condition, and digestive health.

How can I compare horse feed cost between products?

Compare the true daily feeding cost rather than just the bag price. Review feeding rate, nutrient density, and whether the feed replaces other items in the ration. **Horse feed cost** can vary, so ask **how much does horse feed cost** per day for your horse, not just per sack. That provides a fairer picture of value for money.
