

Plumbing Sandy UT Water Heater Flush Maintenance Bumble Bee Hard Water Annual water heater flushing is one of the most beneficial and most skipped maintenance tasks for Sandy homeowners, and in the Wasatch Front's hard water environment the case for regular flushing is more compelling than in softer water markets. The calcium and magnesium that precipitate from Sandy's mineral-heavy water when heated settle as sediment in the bottom of the tank, and over time this sediment accumulation insulates the water from the heating element, increases the energy required to heat the tank, produces the popping and rumbling sounds that many Sandy homeowners describe as their water heater getting louder, and eventually contributes to premature tank failure. Bumble Bee Plumbing performs water heater flushing as a standalone maintenance service for Sandy homeowners and includes water heater assessment as part of the Buzz Club annual inspection for members. The flushing process involves connecting a hose to the drain valve at the base of the tank, directing the flow to an appropriate drain, and flushing water through the tank until it runs clear of sediment. The process typically takes thirty minutes to an hour and is most effective when performed before [Bumble Bee Plumbing Plumber Sandy](#) sediment has accumulated to a level that makes the drain valve difficult to operate without obstruction. Sandy homeowners who have never flushed a tank that has been in service for five or more years should be aware that the sediment level may be significant and that the initial flush may take longer and produce more debris than a tank that has been maintained regularly. In some cases, significant sediment accumulation cannot be fully cleared through a single flush, and additional service may be needed.

Bumble Bee Plumbing | 10178 Heytesbury Ln, Sandy, UT 84092 | (385) 205-1833

The anode rod inspection that Bumble Bee Plumbing performs during the water heater assessment is equally important. The magnesium or aluminum anode rod is the sacrificial component that protects the tank liner from corrosion, and in Sandy's hard water environment anode rods deplete significantly faster than in softer water markets. For water heater flushing and maintenance in Sandy, UT, call Bumble Bee Plumbing at (385) 205-1833.
